Appendix B - 2014 Water Monitoring and Management Work Results

I. Introduction to this Report

This report is intended for local and state oversight agencies, as well as interested citizens. At the local level, it is intended to provide member communities, their elected officials, and staff with an activity update. At the state level, this report meets the annual watershed management organization reporting requirements of Minnesota Rules 8410.0150. The report is intended to fulfill 2014 reporting requirements.

II. About the Sunrise River WMO

The Sunrise River Watershed Management Organization (SRWMO) is a special purpose unit of government that operates as a joint powers organization under Minnesota Statutes, Section 471.59. It is comprised of Linwood Township and portions of the Cities of Columbus, Ham Lake, and East Bethel. Board members are appointed by the member communities. Financing is from member communities. The SRWMO's direction is laid out in its watershed management plan and the member municipalities' local water plans.

The SRWMO area is rich in water and natural resources. Approximately 50% of the area is water and wetlands, including 19 lakes. Five are major recreational lakes (Coon, Fawn, Linwood, Martin, and Typo). 19% of the SRWMO area is high quality natural communities that have undergone little human disturbance since pre-settlement times. Many of these areas have been designated by the State as sites of biodiversity significance or regionally significant ecological areas. 27 plant and animal species that are state endangered, threatened, special concern, or rare are known to occur in the SRWMO. These water and natural resources are at the heart of the character of these north Twin Cities metro communities.

Despite the overwhelming good quality of the natural resources, there are some areas of concern. Martin, Typo, and Linwood Lakes have been designated as "impaired" by the Minnesota Pollution Control Agency for excess nutrients. Several segments of the Sunrise River in Linwood Township are impaired for pH, turbidity, and the fish community. Coon

and Linwood Lakes are infested with two aquatic invasive species: curly leaf pondweed and Eurasian Water Milfoil. There are questions about the effects that improperly maintained septic systems may be having on water quality. Many of these problems flow across community boundaries and cannot be effectively addressed by any one community alone. This is the reason for this joint powers watershed management organization.

The Sunrise River WMO Board of Managers considers its responsibilities to be overseeing the management of water resources in the watershed. The WMO serves the community by:

- Providing a forum to consider inter-community water problems.
- Setting minimum standards for member community ordinances that consider local water resources issues.
- Educating the public about water resources.
- Facilitating water quality improvement projects, which are often cooperative endeavors with others.
- Collecting data and conducting resource monitoring on a watershed basis.
- Providing a linkage between natural resources and land use planning decisions.
- Coordinating water management activities within the WMO among governmental agencies, communities and residents.
- Maintaining a general awareness of existing water problems and the WMO's responsibilities for water management.
- Ensuring expenditures result in corresponding benefits to the public.
- Avoiding duplication among government agencies and communities.

The SRWMO operates under the following philosophies:

- Water-related problems are community problems and not individual problems.
- Water resource management is a vital matter that cannot be effectively addressed by individual communities because watersheds cover multiple communities.
- Water resources should be managed on a watershed basis. The WMO is uniquely positioned to address water resource issues across community boundaries.
- Aquatic and terrestrial areas are integrally linked and cannot be effectively managed separately.

New \$RWMO Watershed Management Plan, JPA

In 2010 the SRWMO began implementing our new 10-year watershed management plan. The new plan can be found on the SRWMO website (www.SRWMO.org).

c. Highlighted Recent Projects

Martin and Typo Lake Carp Barriers (2012-15)

A series of four barriers are being installed to control carp in Martin and Typo Lakes in order to improve water quality and habitat. As of the end of 2014, one barrier has been installed. The remaining three will be installed in 2015. This project is funded by \$435,753 in MN DNR Conservation Partners Legacy grants, the Sunrise River WMO, Martin Lakers Association and Anoka Conservation District.

Coon Lake Stormwater Retrofits (2014-2015)

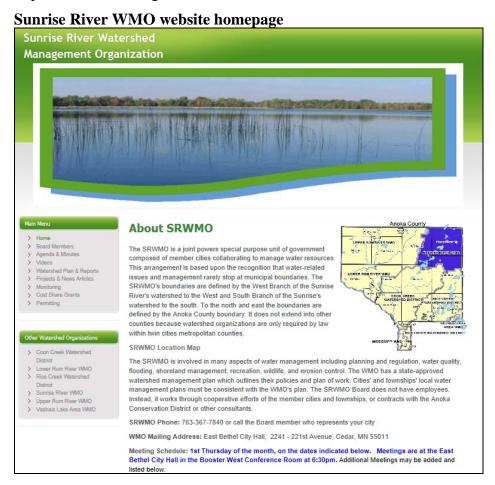

A network of practices to better treat stormwater runoff will be installed, primarily in 2015 or early 2016. The projects were identified in the 2013 Coon Lake Subwatershed Assessment and will be installed in order of cost effectiveness at pollutant reduction. Likely projects for installation include three lakeshore restorations, two rain gardens and one structural stabilization. This project is funded by a \$42,987 2014 BWSR Clean Water Fund Grant, the SRWMO, Coon Lake Improvement District, Coon Lake Improvement Association and Coon Lake Beach Community Center.

d. Public Outreach

The SRWMO does regular public outreach and education projects, but the WMO's website serves as the primary, continuous public outreach tool. Website contents include general information about the organization, meeting agendas and minutes, water monitoring results, profiles of WMO projects, and access to mapping and data

access tools. The website serves as an alternative to the state-mandated annual newsletter. The SRWMO ensures visibility of its website by asking member cities and townships to post the SRWMO website address in their newsletters. Links to the SRWMO website are also provided through each member community's website and the Anoka Conservation District website. The SRWMO website address is http://www.srwmo.org

e. Implementation of Watershed Management Plan

The SRWMO Watershed Management Plan contains a schedule of tasks that the WMO should accomplish in order to realize its goals (see table on following page). In the past, the focus has been on understanding water resources through monitoring. The 3rd Generation Watershed Management Plan finalized 2010 uses that past monitoring to inform a number of water quality improvement projects. The implementation of the plan is subject to minor adjustments as understanding of water resources changes.

The table on the following pages compares work planned in the Watershed Management Plan and work actually accomplished. In 2014 one minor deviation from the Watershed Management Plan occurred. These include:

Change Deleted 2014 stream hydrology and water quality monitoring.

Reason

This task was planned to monitor the effectiveness of water quality improvement projects. At this time, projects were underway, but not yet installed. A good baseline of pre-project monitoring data already exists. Effectiveness monitoring will occur after project installation.

Appendix B has detailed work results for the most recent year. For results of work in earlier years, please visit the SRWMO website (www. SRWMO.org).

Work planned in the SRWMO Watershed Plan and actually accomplished for the last 5 years. Numbers are number of sites monitored.

f. 2015 Work Plan (insurance, secretarial and similar operating expenses are not included)

Task	Purpose	Description	Locations or Action	Cost
Prepare 2012 Annual Report to BWSR and municipalities (this report)	To provide transparency and accountability of organization operations. To improve communication with member communities.	Produce an annual report of SRWMO activities and finances that satisfies Minnesota Rules 8410.0150 and is an effective tool for reporting WMO accomplishments to member city councils. The goal is to allow the city councils to better understand the SRWMO's work.	Secured Anoka Conservation District (ACD) staff to assist with this task.	\$735
Prepare Annual Report to State Auditor	To provide transparency and accountability of organization operations.	Online reporting of WMO finances though the State Auditor's SAFES website.	Watershed- wide	\$300
Adminis- trator (on- call, limited)	To provide a day-to-day WMO contact for the public and partners. To complete day-to-day miscellaneous operational tasks.	Day-to-day WMO administration.	ACD has been hired to provide this service up to 20.5 hours.	\$1,875
Grant search and applications	Obtain outside funding for water quality improvement projects.	Search for grant opportunities and apply for those that are applicable to SRWMO projects.	ACD has been hired to provide this service. Five projects for which to pursue grants were selected.	\$1,000
Lake Level Monitoring	To understand lake hydrology, including the impact of climate or other water budget changes. These data are useful for regulatory, building/development, and lake management decisions.	Weekly water level monitoring in lakes by volunteers. All are available on the Minnesota DNR website using the "LakeFinder" feature (www.dnr.mn.us.state \lakefind\index.html).	Coon, Linwood, Martin, Fawn, and Typo Lakes	\$1,250
Lake Water Quality Monitoring	To detect water quality trends and diagnose the cause of changes.	May through September twice-monthly monitoring of the following parameters: total phosphorus, chlorophyll-a, secchi transparency, dissolved oxygen, turbidity, temperature, conductivity, pH, and salinity.	Fawn Lake Linwood Lake	\$3,250
Monitoring of Water Quality Improve- ment Project Effective- ness	Determine the effectiveness of practices installed to improve water quality.	Monitoring Martin and Typo Lakes immediately prior to installation of carp barriers. Post installation monitoring is anticipated as well.	Martin Lake Typo Lake	\$3,250

Task	Purpose	Description	Locations or Action	Cost
Stream Water Quality Monitoring	To detect water quality trends and diagnose the cause of changes.	4 baseflow samples, 4 during storms. Parameters: stage, total phosphorus, TSS, Secchi tube, dissolved oxygen, turbidity, temperature, conductivity, pH, and salinity.	1. W Branch Sunrise R at CR 77 2. S Branch Sunrise R at Hornsby St	\$2,800
Stream Hydrology Monitoring	To understand hydrology at the two outlet points of the SRWMO jurisdictional area. This hydrology data is also paired with water quality monitoring to allow pollutant load calculations.	Continuous water level monitoring in streams with automated equipment.	1. W Branch Sunrise R 2. S Branch Sunrise R 3. Ty Cr at Typo Lake outlet 4. Typo Cr at Typo Cr Dr	\$2,500
Reference Wetland Monitoring	To provide understanding of wetland hydrology, including the impact of climate and land use. These data aid in delineation of nearby wetlands by documenting hydrologic trends including the timing, frequency, and duration of saturation.	Continuous groundwater level monitoring at a wetland boundary, to a depth of 40 inches. This is part of a network of 18 wetland hydrology monitoring stations county-wide.	1. Carlos Avery Reference Wetland 2. Carlos 181st Reference Wetland, 3. Tamarack Reference Wetland	\$1,725
Fawn Lake Curly Leaf Pondweed Assessment	To determine the extent of infestation and assess control needs.	Lake-wide mapping of the presence and abundance of curly leaf pondweed.	Fawn Lake	\$675
Cost Share Grants for Water Quality Improve- ment	To improve water quality in lakes, rivers, and streams.	These grants offer up to 70% cost sharing of the materials needed for a water quality improvement project. The landowner is responsible for the remainder of materials, all labor, and any aesthetic components of the project. Typical projects include erosion correction, lakeshore restoration, and rain gardens. The Anoka Conservation District provides grant administration and technical assistance to landowners. SRWMO funds are used only in the SRWMO area.	No contribution to grant fund in 2015 due to adequate fund balance.	\$0
Coon Lake Area Stormwater Retrofits	To improve Coon Lake water quality.	BMPs identified in the Coon Lake Area Stormwater Assessment will be installed in order for cost effectiveness at pollutant reduction. A BWSR CWF grant is secured.	Coon Lake area	\$15,000
Other Water Quality Projects	To improve water quality.	2015 funds shall be used in the following order (a) contingency for Coon Lake stormwater retrofits, (b) Ditch 20 feasibility study, (c) applied to other projects per board approval.	See column to right.	\$6,750
SRWMO Website	To increase awareness of the SRWMO and its programs. The website also provides tools and information that helps users better understand water resources issues in the area.	Annually maintain and update the SRWMO website with current information about the organization, meeting minutes and agendas, and watershed plan update information.	http://www. Srwmo.org	\$490

Task	Purpose	Description	Locations or Action	Cost
Lakeshore Land- scaping Marketing	Promote water quality projects such as lakeshore restorations, rain gardens, and others.	Distribute to 670 lakeshore properties the booklet entitled "Outdoors in Anoka County: a homeowners guide."	Throughout watershed	\$1,810
Annual Ed publication	Inform the public about the SRWMO. Meet state requirements for an annual publication.	An article will be written that is informative about the SRWMO, recent projects, and includes educational messages chosen by the SRWMO Board. It is distributed to member communities for inclusion in their newsletters.	Throughout watershed	\$500

The following deviations from watershed plan are anticipated in 2015:

Change	No contribution to	water quality	cost share	grant fund.
Change	1 to committed to	water quarre	, cost siluic	grant rana.

Reason Fund has carry-over funding from previous years sufficient to fund several

projects.

Change Increased the number of stream hydrology monitoring sites from two to

four.

Reason The two added sites are at carp barrier installation locations. The board

wished to monitor water levels on both sides of the barriers 24-hours per day to ensure no adverse hydrological effects. While engineers have assured there will be no such adverse effects, some residents may question

this. 24-hour per day data is the best way to be informed.

Change Decreased "discretionary/other water quality projects" from \$10,000 to

\$6,750.

Reason To accommodate additional stream hydrology monitoring, which was a

priority.

Change Decreased 2015 expenditures on Coon Lake area stormwater retrofit

installations by \$5,000.

Reason The watershed planned for \$20,000 in each 2014 and 2015. In order to

keep overall budgets more level in these years, the board elected to budget

\$25,000 in 2014 and \$15,000 in 2015. Total expenditures were as

planned.

g. Status of Local Water Plan Adoption and Implementation

All SRWMO member communities are required to have a Local Water Plan that is consistent with the SRWMO Watershed Management Plan. The WMOs have approval authority over these Local Water Plans. Whenever a WMO plan is updated the member municipalities have two years to update their Local Water Plans, ordinances, and other control measures to be consistent with the WMO Plan.

All local water plans have been approved. The following is the status of each city or township's local water plan:

<u>Linwood Township</u> – Linwood Township has adopted the SRWMO Watershed Management Plan by reference.

<u>Ham Lake</u> – The Ham Lake Local Water Plan was reviewed in January 2012. The staff recommendation is for approval, contingent upon inclusion of the SRWMO wetland standards. The City took this action and their plan was approved by the SRWMO February 7, 2013.

East Bethel – The SRWMO received a draft local water plan in June 2010. Changes were requested. In May 2011 a final draft was received and approved.

<u>Columbus</u> – Approved at the February 2011 SRWMO meeting.

To track member cities' progress on local plan implementation, the URRWMO requires a brief annual report from each city and provides a template for this report. In addition to serving as a reporting tool, the template serves as a "to do" list for our cities. These reports are available upon request, and are summarized in the table below.

Status of city local water plans and some recent accomplishments toward plan implementation.

Linwood Township

Status of ordinances and control measures Submitted 2014 annual report to URRWMO?

No

Some Recent Implementation Accomplishments

City of East Bethel

Status of ordinances and control measures

The City has the full suite of ordinances required by the SRWMO.

Submitted 2014 annual report to URRWMO?

Yes

Some Recent Implementation Accomplishments

- Education materials distributed to 11,000 residents on the topics of wetland buffers, water quality monitoring, groundwater protection, hazardous waste disposal, yard waste management, ag BMPs, pet waste disposal and the activities of the SRWMO.
- Completed mapping of stormwater system in 2014.
- Annual street sweeping.
- Inspected over half of stormwater treatment basins in 2014. Remainder to be done before June 2015.

City of Ham Lake

Status of ordinances and control measures

The City has the full suite of ordinances required by the SRWMO.

Submitted 2014 annual report to URRWMO?

Yes

Some Recent Implementation Accomplishments

- Completed stormwater system mapping and inspections of storm water treatment basins as required by the WMO.
- Created an illicit discharge ordinance.
- Street sweeping.
- Ongoing work to complete BMP's in the City's Storm Water Pollution Prevention Plan.
- Educational efforts through the City's newsletter, which reaches the entire population of 6,700 households and businesses. Educational article topics in 2014 included groundwater protection, water conservation, hazardous waste disposal, yard waste management, ag BMPs, pet waste disposal, and activities of the SRWMO.

City of Columbus

Status of ordinances and control measures

The City has the full suite of ordinances required by the SRWMO.

Submitted 2014 annual report to URRWMO?

Yes

Some Recent Implementation Accomplishments

- Educational efforts through the City's newsletter, which reaches the entire population of 1,447 households and businesses. Educational article topics in 2014 included wetland buffers, water quality monitoring, groundwater protection, controlling invasive species, hazardous waste disposal and activities of the SRWMO.
- Partially completed mapping of stormwater systems. Completion was required by the WMO by 2014.
- Street sweeping.
- Inspections of storm water treatment basins.

h. Solicitations for Services

State rules require watershed management organizations to solicit bids for professional services at least once every two years. Most recently the SRWMO solicited bids in September 2013 for work to occur in 2014. Work included hydrology monitoring, water quality monitoring, overseeing water quality improvement projects, website, preparing annual reports, grant searches, administrative assistance, and public education.

We solicited proposals by contacting engineering firms which already serve WMO member cities, plus the Anoka Conservation District. We left our request for proposals open for several months. We received only one response, from the Anoka Conservation District, and selected them for the work.

In 2015 the SRWMO plans to solicit bids for services in 2016.

i. Permits, Variances, and Enforcement Actions

The SRWMO does not issue permits, variances, or take enforcement actions. These responsibilities are held by the member municipalities, as outlined in each municipality's local water plan, ordinances, and policies.

j. Status of Locally Adopted Wetland Banking Program

The SRWMO does not have a locally adopted wetland banking program.

IV. Financial and Audit Report

a. 2014 Financial Summary

See Appendix A – 2013 Financial Report.

b. Fund Balances

See Appendix A – 2014 Financial Report.

c. Financial Report Documentation

An annual financial report is complete. That report is Appendix A.

As of March 2015, the SRWMO is planning an audit of 2014 finances. It is not yet available, but will be submitted to the MN Board of Water and Soil Resources upon completion.

a. 2015 Budget

At its May 1, 2014 meeting the SRWMO Board approved a 2015 budget of \$47,010. Budget details are below.

2015 SRWMO Budget Breakout - 5/1/14

_		Linwood	East Bethel	Columbus	Ham Lake

2014 Financial Report

SUNRISE RIVER WATERSHED MANAGEMENT ORGANIZATION

FINANCIAL REPORT FOR YEAR ENDED DECEMBER 31, 2014

To the Chairperson, Dan Babineau, of Sunrise River Water Management Organization

The enclosed statement has been prepared after review of the organization's financial records for 2014. I have not audited the organization's records and do not express an opinion. The enclosed information fairly reflects the Sunrise River WMO's financial position for the stated year, based on records provided to me by the organization.

March 12, 2015

Lake Levels

Description: Weekly water level monitoring in lakes. The past five years are shown below, and all historic

data are available on the Minnesota DNR website using the "LakeFinder" feature

(www.dnr.mn.us.state\lakefind\index.html).

Purpose: To understand lake hydrology, including the impact of climate or other water budget changes.

These data are useful for regulatory, building/development, and lake management decisions.

Locations: Coon, Fawn, Linwood, Martin, and Typo Lakes

Results: Lake levels were measured by volunteers throughout the 2014 open water season. Lake gauges

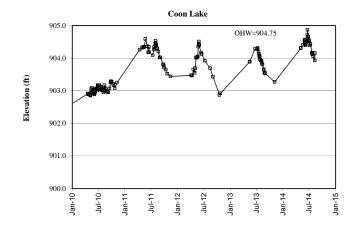

were installed and surveyed by the Anoka Conservation District and MN DNR. Lakes had sharply increasing water levels in spring and early summer 2014 when very heavy rainfall totals

occurred. Rainfall tapered off later in the year and lake levels fell accordingly.

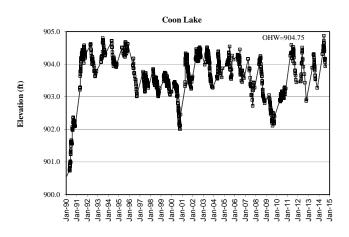

All lake level data can be downloaded from the MN DNR website's Lakefinder feature. Ordinary High Water Level (OHW), the elevation below which a DNR permit is needed to perform work,

is listed for each lake on the corresponding graphs below.

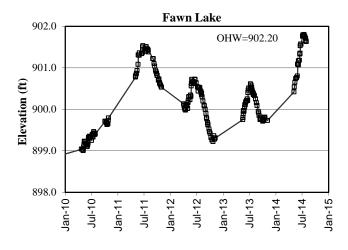

Coon Lake Levels – last 5 years

Lake Water Quality

Description: May through September every-other-week monitoring of the following parameters: total

phosphorus, chlorophyll-a, secchi transparency, dissolved oxygen, turbidity, temperature,

conductivity, pH, and salinity.

Purpose: To detect water quality trends and diagnose the cause of changes.

Locations: Coon Lake East Bay

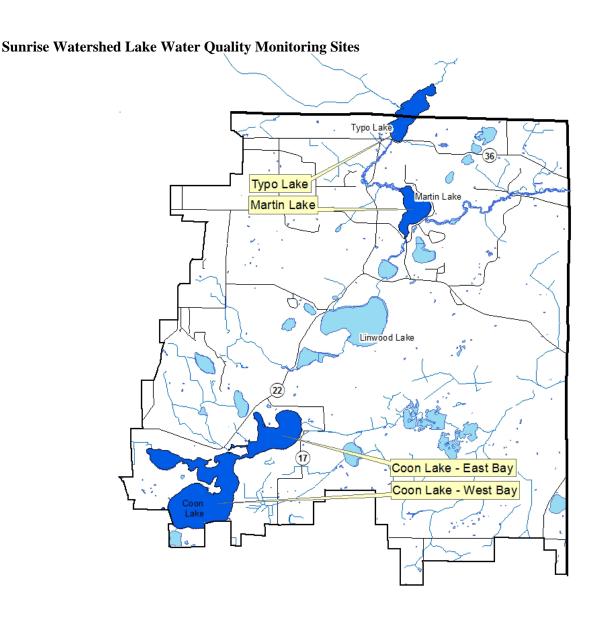

Coon Lake West Bay

Martin Lake Typo Lake

Results: Detailed data for each lake are provided on the following pages, including summaries of

historical conditions and trend analysis. Previous years' data are available from the ACD. Refer

to Chapter 1 for additional information on interpreting the data and on lake dynamics.

Coon Lake –East and West Bays City of East Bethel, City of Ham Lake & City of Columbus, Lake ID # 02-0042

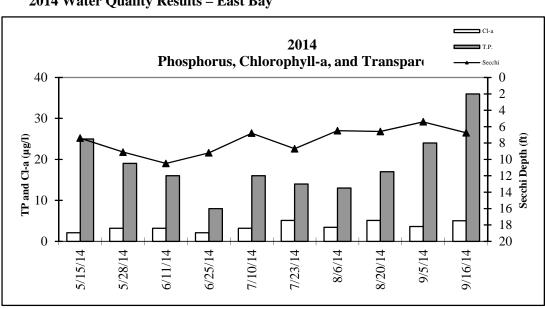

Background

Coon Lake is located in east central Anoka County and is the county's largest lake. Coon Lake has a surface area of 1498 acres and a maximum depth of 27 feet (9 m). Public access is available at three locations with boat ramps, including one park with a swimming beach. The lake is used extensively by recreational boaters and fishers. Most of the lake is surrounded by private residences. The watershed of 6,616 acres is rural residential.

This report includes information for the East Bay (aka northeast or north bay) and West Bay (aka southwest or south bay) of Coon Lake in 2014. The 2010-14 data is from the Anoka Conservation District (ACD) monitoring at the MN Pollution Control Agency (MPCA) monitoring site #203 for the East Bay and #206 for the West Bay. Over the years, other sites have been monitored and are included in this report's trend analysis when appropriate. When making comparisons between the two bays, please consider that both bays were monitored simultaneously only in 2010, 2012 and 2014; data from other years do not lend themselves well to direct comparisons because monitoring regimes were likely different.

2014 Results - East Bay

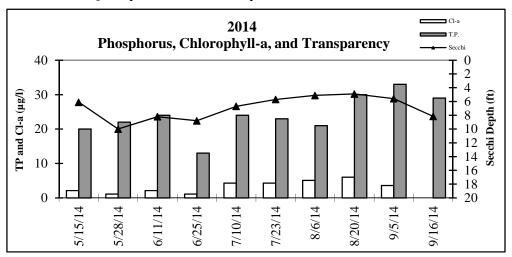

In 2014 the East Bay was monitored every 2 weeks. The water quality is better than average for this region of the state (NCHF Ecoregion), receiving an A grade. Average values of important water quality parameters included 18.8 µg/L for total phosphorus, 3.6 µg/L chlorophyll-a, and Secchi transparency of 7.7 feet. Both Chlorophyll-a and phosphorous levels were the lowest of all monitored years. In addition, both have seen a drop in each of the last 5 years. Similarly, transparency results were the second deepest observed in all monitored years and had shown improvement in each of the last 5 monitoring years. The subjective observations of the lake's physical characteristics and recreational suitability by the ACD staff indicated that lake conditions were excellent for swimming and boating.

2014 Water Quality Results - East Bay

2014 Results - West Bay

In 2014 the West Bay had average water quality for this region of the state (NCHF Ecoregion), receiving a B letter grade. Average values of water quality parameters included 23.9 µg/L for total phosphorus, 3.3 µg/L chlorophyll-a, and Secchi transparency of 6.9 feet. Chlorophyll-a and phosphorus levels were the lowest of all monitored years. Despite receiving a B grade, Secchi transparency results were the deepest observed in over 10 years and the second deepest of all monitored years.

2014 Water Quality Results -West Bay

Comparison of the Bays

The East and West Bays of Coon Lake often have noticeably different water quality. In 2010, on every date water quality was better in the West Bay than East. In both 2012 and 2014, water quality in the two bays was more similar. The East Bay typically had lower phosphorus readings, though the average differed by only $5.1 \,\mu\text{g/L}$. Chlorophyll-a readings were more frequently lower in the West bay but the average reading only differed by $0.3 \,\mu\text{g/L}$. Secchi transparency was consistently deeper in the East Bay but the average reading differed by $0.77 \,\text{ft}$.

Trend Analysis

To analyze Coon Lake trends we obtained historic monitoring data from the MPCA. Over the years water quality has been monitored at 17 sites on the lake. For the trend analysis, we pooled data from five East Bay sites (#102, 203, 208, 209, and 401) and four West Bay sites (#101, 105, 206, and 207). These sites were chosen because they were all in the bay of interest, close to each other, and distant from the shoreline. The trend analysis is based on average annual water quality data for each year with data. We used data only from years with data from every month from May to September, except we allowed one month of missing data. Only data from May to September were used. Starting in 1998 only data from ACD was used for greater comparability.

East Bay Trend Analysis

In the East Bay twenty one years of water quality data have been collected since 1978. During the most recent 13 years that were monitored (since 1996), the data collected included total phosphorus, chlorophyll-a, and Secchi transparency. For most of the other eight years (all pre-1997) only Secchi transparency data is available. This provides an adequate dataset for a trend analysis, however given that most of the data is from the last 21 years, the analysis is not strong at detecting changes that occurred prior to 1990.

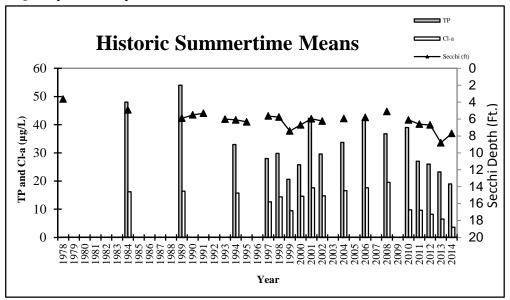

When we examined those years with total phosphorus, chlorophyll-a, and Secchi transparency, excluding the years with only Secchi transparency data an improving water quality trend does exist. The analysis was a

repeated measures MANOVA with response variables TP, Cl-a, and Secchi depth ($F_{2,14}$ =4.37, p=0.03). This is our preferred approach because it examines all three parameters simultaneously.

We also examined variables TP, Cl-a, and Secchi depth across all years of existing data using a one-way ANOVA. Including all years, a significant trend of improving TP ($F_{1,16}$ =7.12, p=0.02) , Cl-a ($F_{1,16}$ =7.13, p=0.02), and transparency ($F_{1,20}$ =11.30, p=0.0033) is found. In summary, it appears that water quality improvements have been occurring.

It is noteworthy that a water quality improvement seems to have occurred over the last few years (see graph below). The reason for such a change, if real, is unknown.

Historic Water Quality - East Bay

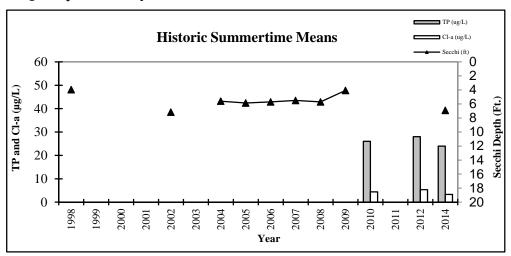

West Bay Trend Analysis

Ten years of data are available for the West Bay including only two years with phosphorus and chlorophyll-a data, so a powerful trend analysis is not possible. The dataset for Secchi transparency is longer, but data from 2010 and 2012 must be excluded because a full suite of Secchi measurements is not available due to clarity exceeding the lake depth occasionally. Therefore, a statistical analysis would not be highly meaningful. Instead, we'll use a non-analytical look at the data.

In 2014 the average secchi was 6.93 feet. For eight monitored years in 1998-2009, seven of those years had average secchi of <6 feet. It's notable that in the two most recent years the average secchi transparency was greater than in all but one of previous years. It suggests that if anything, transparency is mildly improving.

Historic Water Quality - West Bay

Discussion

While Coon Lake is not listed as "impaired" by the MN Pollution Control Agency, the East Bay has been close to the state water quality standard of 40 μ g/L of phosphorus or greater in the past. In 2006 phosphorus averaged 42 μ g/L, was 37 μ g/L in 2008, and in 2010 was 39 μ g/L. However, 2011 was the beginning of a 4 year consecutive decline in phosphorous levels. Phosphorous levels dropped to 27 μ g/L in 2011, again to 26 μ g/L in 2012, again to 23.2 μ g/L (second lowest on record) in 2013, and in 2014 hit an all-time low of 18.8 μ g/L. While recent results appear to be trending in the right direction, continued efforts to improve water quality are strongly encouraged to prevent the lake from becoming designated as "impaired." Such a designation would trigger an in-depth study under the Federal Clean Water Act.

Given the highly-developed nature of the lakeshore, the practices of lakeshore homeowners are a reasonable place to begin water quality improvement efforts. Residents should increase the use of shoreline practices that improve water quality and lake health, such as native vegetation buffers and rain gardens. Clearing of native vegetation to create a "cleaner" lakefront should be avoided because this vegetation is important to lake health and water quality. Septic system maintenance and replacement where necessary, should be a priority on an individual home basis and on a community level. This might be most beneficial in the Hiawatha Beach, Interlachen, and Coon Lake Beach neighborhoods, where the greatest frequency of septic system failures is suspected.

A final challenge for Coon Lake is the aquatic invasive species Eurasian water milfoil (EWM) and Curly Leaf Pondweed (CLP). EWM was discovered in the lake in 2003 and spread rapidly. In 2008 a Coon Lake Improvement District (CLID) was formed, with EWM management as a core of its function. EWM is actively monitored and treated with herbicide in accordance with DNR rules and a lake vegetation management plan. CLP has been present longer. CLID started treatment of CLP in 2009. In 2010 the East Bay was accepted into a five year pilot program for treatment of CLP. There is not yet enough data to say definitively, but it is possible that early season treatment of CLP could be a contributing factor in the recent decline in phosphorous levels. CLP takes up phosphorous from the soil through its root system and dies off early summer causing a spike in phosphorous. Early treatment may be shortening the time the CLP has to uptake phosphorous from the soil as well as reducing overall regrowth due to treatments occurring prior to CLP sprouting turions (a shoot vital to reproduction).

Typo Lake

Linwood Township, Lake ID # 03-0009

Background

Typo Lake is located in the northeast portion of Anoka County and the southeast portion of Isanti County. It has a surface area of 290 acres and maximum depth of 6 feet (1.82 m), though most of the lake is about 3 feet deep. The lake has a mucky, loose, and unconsolidated bottom in some areas, while other areas have a sandy bottom. Public access is at the south end of the lake along Fawn Lake Drive. The lake is used very little for fishing or recreational boating because of the shallow depth and extremely poor water quality. The lake's shoreline is mostly undeveloped, with only 21 homes within 300 feet of the lakeshore. The lake's watershed of 11,520 acres is 3% residential, 33% agricultural, 28% wetlands, with the remainder being forested or grassland. Typo Lake is on the Minnesota Pollution Control Agency's (MPCA) list of impaired waters for excess nutrients.

2014 Results

In 2014 Typo Lake had extremely poor water quality compared to other lakes in this region (NCHF Ecoregion), receiving an overall D- letter grade. While the overall grade is still poor, it is the best grade received in all years monitored. In addition, some of the most important parameters were the best they have ever been observed. In the worst two years of results, total phosphorus averaged 340 (2007) and 353 μ g/L(2009), respectively. Total phosphorus in 2014 averaged 182 μ g/L, which while still very high, but is the lowest observed since 1997. Chlorophyll-a levels were lower in 2014 (42.8 μ g/L) than in any other year in monitored history. In both 2007 and 2009 a bright white Secchi disk could be seen only 5-6 inches below the surface, on average. There was a slight improvement in 2012 to 9-10 inches and a larger improvement in 2014 to 21-22 inches. The reason for the especially poor conditions in 2007 and 2009 seems to be drought-induced low water levels. To that same sentiment, it is reasonable to believe that the improvements observed in 2014 may be a result of above average rainfall.

Trend Analysis

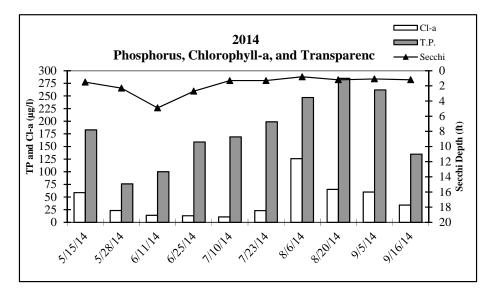

Fourteen years of water quality monitoring have been conducted by the Minnesota Pollution Control Agency (1993, '94, and '95) and the Anoka Conservation District (1997-2001, '03, '05, '07, '09, '12, '14). Water quality has significantly deteriorated from 1993 to 2014 (repeated measures MANOVA with response variables TP, Cl-a, and Secchi depth; $F_{2,11}$ =4.84, p=0.03). Though, tested individually (one-way ANOVAs on the individual response variables) TP, Cl-a, and Secchi depth show no significant change. The trend toward poorer phosphorus and transparency continue to appear to be strong despite the fact that in 2012 and 2014 these parameters were slightly better than the previous years monitored.

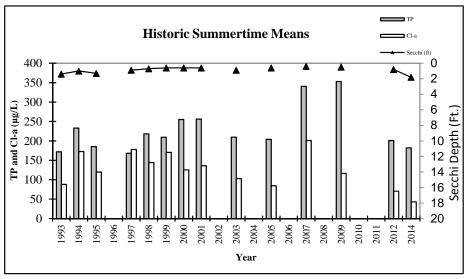

Discussion

Typo Lake, along with Martin Lake downstream, were the subject of TMDL study by the Anoka Conservation District which was approved by the State and EPA in 2012. This study documented the source of nutrients to the lake, the degree to which each is impacting the lake, and put forward lake rehabilitation strategies. Some factors impacting water quality on Typo Lake include rough fish, high phosphorus inputs from a ditched wetland west of the lake, and lake sediments. A carp barrier project between Martin and Typo lakes has been approved and funded. The first barrier was installed in 2014 with contractors set to install the final three in 2015.

Carlson's Trophic State Index

Martin Lake

Linwood Township, Lake ID # 02-0034

Background

Martin Lake is located in northeast Anoka County. It has a surface area of 223 acres and maximum depth of 20 ft. Public access is available on the southern end of the lake. The lake is used moderately by recreational boaters and fishers, and would likely be used more if water quality improved. Martin Lake is almost entirely surrounded by private residences. The 5402 acre watershed is 18% developed; the remainder is vacant, agricultural, or wetlands. The non-native, invasive plant curly-leaf pondweed occurs in Martin Lake, but not at nuisance levels. Martin is on the Minnesota Pollution Control Agency's (MPCA) list of impaired waters for excess nutrients.

2014 Results

In 2014 Martin Lake had poor water quality compared to other lakes in the North Central Hardwood Forest Ecoregion (NCHF), receiving a C letter grade. This eutrophic lake has chronically high total phosphorus and chlorophyll-a. In 2014 total phosphorus averaged 91.0 μ g/L, slightly below the lake's historical average of 92.1 μ g/L but still well above the impairment threshold of 60 μ g/L. Chlorophyll-a was the lowest observed in the lakes monitored history at 15.5 μ g/L. Average Secchi transparency was only 3.4 feet in 2014 but slightly better than the historical average. ACD staff's subjective perceptions of the lake were that "high" algae made the lake less than desirable for swimming from July through September.

Trend Analysis

Thirteen years of water quality data have been collected by the Minnesota Pollution Control Agency (1983), Metropolitan Council (1998, 2008), and ACD (1997, 1999-2001, 2003, 2005, 2007, 2009, 2012, 2014). Citizens monitored Secchi transparency 17 other years. Anecdotal notes from DNR fisheries data indicate poor water quality back to at least 1954. A water quality change from 1983 to 2014 is detectable with statistical tests (repeated measures MANOVA with response variables TP, Cl-a, and Secchi depth; F_{2,10}=7.96, p=<0.01). However, further examination of the data reveals that no water quality parameter alone has changed significantly, and the direction of their changes is mixed. If the oldest year of data (1983) is excluded, there is no longer a statistically significant trend. Because the statistical trend is dependent upon one year's data and the direction of change is mixed among the parameters, the statistical trend can be largely discounted. No true trend likely exists.

Discussion

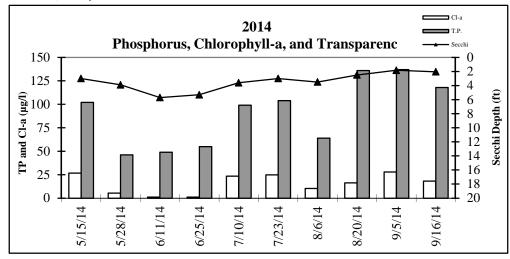

Martin Lake, along with Typo Lake upstream, were the subject of an TMDL study by the Anoka Conservation District that was approved by the State and EPA in 2012. This study documented the source of nutrients to the lake, the degree to which each is impacting the lake, and put forward lake rehabilitation strategies. Water from Typo Lake and internal loading (carp, septic systems, sediments, etc) are two of the largest negative impacts on Martin Lake water quality. A carp barrier project between Martin and Typo lakes has been approved and funded. The first barrier was installed in 2014 with contractors set to install the final two in 2015.

WETLAND HYDROLOGY

Description: Continuous groundwater level monitoring at a wetland boundary, to a depth of 40 inches.

County-wide, the ACD maintains a network of 18 wetland hydrology monitoring stations.

Purpose: To provide understanding of wetland hydrology, including the impact of climate and land use.

These data aid in delineation of nearby wetlands by documenting hydrologic trends including the

timing, frequency, and duration of saturation.

Locations: Carlos Avery Reference Wetland, Carlos Avery Wildlife Management Area, City of Columbus

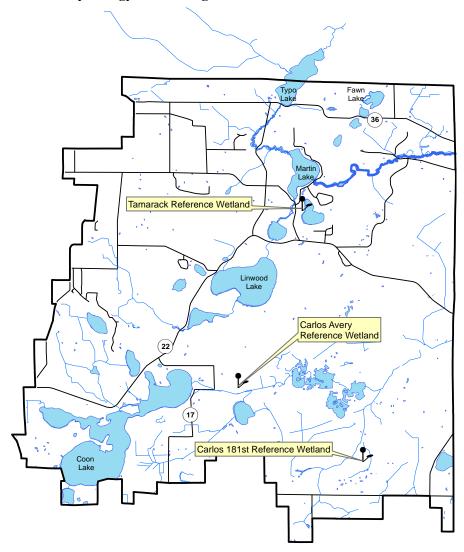

Carlos 181st Reference Wetland, Carlos Avery Wildlife Management Area, City of Columbus

Tamarack Reference Wetland, Linwood Township

Results: See the following pages. Raw data and updated graphs can be downloaded from

www.AnokaNaturalResources.com using the Data Access Tool.

Sunrise Watershed Wetland Hydrology Monitoring Sites

CARLOS AVERY REFERENCE WETLAND

Carlos Avery Wildlife Management Area, City of Columbus

Site Information

Monitored Since: 1997

Wetland Type: 3

Wetland Size: >300 acres

Isolated Basin? No Connected to a Ditch? Yes

Soils at Well Location:

Horizon	Depth	Color	Texture	Redox
Oa	0-4	N2/0	Organic	-
Bg	4-25	10yr 5/2	Sandy Loam	25% 10yr 5/6

2014 Hydrograph

Well depth was 35 inches, so a reading of -35 indicates water levels were at an unknown depth greater than or equal to 35 inches.

Water Quality Grant Fund

Description: The Sunrise River Watershed Management Organization (SRWMO) offers cost share grants

encourage projects that will benefit lake and stream water quality. These projects include lakeshore restorations, rain gardens, erosion correction, and others. These grants, administered by the ACD, offer 50-70% cost sharing of the materials needed for a project. The landowner is responsible for the remaining materials expenses, all labor, and any aesthetic components of the project. The ACD assists interested landowners with design, materials acquisition, installation,

and maintenance.

Purpose: To improve water quality in area lakes, streams, and rivers.

Locations: Throughout the watershed.

Results: Projects reported in the year they are installed. No projects were installed in 2014.

Coon Lake Area Stormwater Retrofit Analysis

Description: A Stormwater Retrofit Analysis is a systematic approach of identifying opportunities for

improved stormwater treatment within a subwatershed of a high priority waterbody. Once stormwater retrofit options are identified, they are modeled to determine pollutant removal benefits. Costs for each potential project are estimated. Finally, the cost effectiveness of each project is calculated and projects are ranked accordingly. The final report serves as a guide for

installing water quality projects in a cost effective manner.

Purpose: To improve Coon Lake water quality.

Results: The Anoka Conservation District (ACD) was contracted to complete a Stormwater Retrofit

Analysis of the Coon Lake subwatershed. ACD performed watershed-wide field reconnaissance and completed GIS analysis. Potential projects have been assembled in a comprehensive list.

This stormwater analysis focuses on "stormwater retrofitting" and ranking projects on cost effectiveness. Stormwater retrofitting refers to adding stormwater treatment to an already built-up area, where little open land exists. This process is investigative and creative. Stormwater retrofitting success is sometimes improperly judged by the number of projects installed or by comparing costs alone. Those approaches neglect to consider how much pollution is removed per dollar spent. In this stormwater analysis we estimated both costs and pollutant reductions and used them to calculate cost effectiveness of each possible project.

Areas that drain to Coon Lake were delineated using available GIS watershed information, maps of stormwater conveyance features (where available), and advanced GIS terrain analysis technologies. Those areas were then divided into 7 smaller stormwater drainage areas, or catchments. For each catchment, modeling of stormwater volume and pollutants was completed using water quality software for urban (WinSLAMM) and rural agrarian (SWAT) landscapes. Base (without any stormwater treatment) and existing (with present day stormwater treatment) conditions were modeled. In total, under existing conditions the subwatershed contributes an estimated 2,455 acre feet (ac-ft) of runoff, 809 pounds of phosphorus, and 81 tons of suspended solids each year.

Potential stormwater retrofits identified during this analysis were modeled to estimate reductions in volume, total phosphorus (TP), and total suspended solids (TSS). Finally, cost estimates were developed for each retrofit project, including up to 30 years of operations and maintenance. Projects were ranked by cost effectiveness with respect to their reduction of TP.

A variety of stormwater retrofit approaches were identified. They include:

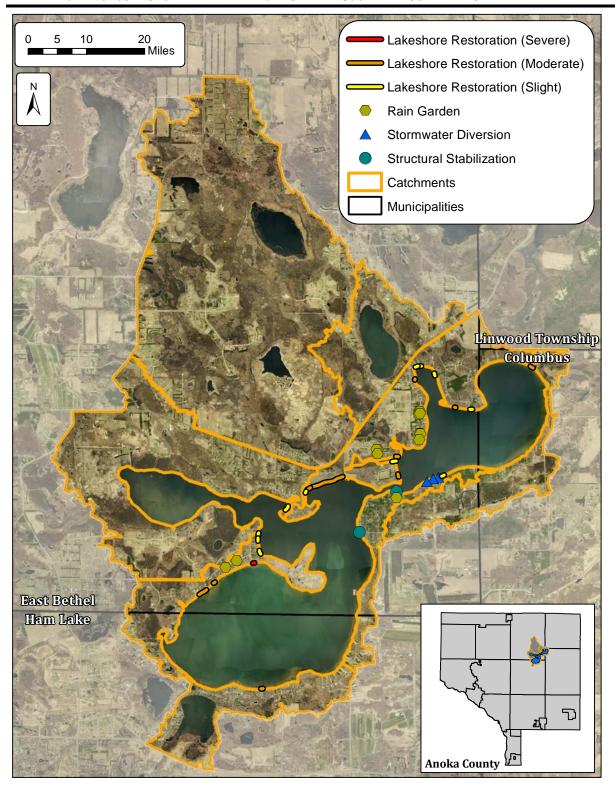

- Maintenance of, or alterations to, existing stormwater treatment practices,
- Residential curb-cut rain gardens,
- Lakeshore restorations,
- Stabilization of erosion sites, and
- Stormwater redirection.

This report provides conceptual sketches or photos of recommended stormwater retrofitting projects. The intent is to provide an understanding of the approach. If a project is selected, site-specific designs must be prepared. In addition, many of the proposed retrofits will require engineered plan sets if selected. This typically occurs after

committed partnerships are formed to install the project. Committed partnerships must include willing landowners when installed on private property.

The tables on the next pages summarize 30 potential projects organized from most cost effective to least, based on cost per pound of TP removed. If all of these practices were installed, pollutant loading to Coon Lake could be reduced by 25.3 lbs of TP and 12.8 tons of TSS. The 25.3 lbs-TP reduction could potentially reduce algal growth in the lake by 6.3 tons (assuming 1 lb phosphorus = 500 lbs algae). Reported treatment levels are dependent upon optimal site selection and sizing. More detail about each project can be found in the Catchment Profile pages of this report. Projects that were deemed unfeasible due to prohibitive size, number, or were too expensive to justify installation are not included in this report.

Installing all of these projects is unlikely due to funding limitations and landowner interest. Instead, it is recommended that projects be installed in order of cost effectiveness (pounds of pollution reduced per dollar spent). Other factors, including a project's educational value, visibility, construction timing, total cost, or non-target pollutant reduction also affect project installation decisions and will need to be weighed by resource managers when selecting projects to pursue.

phosphorus (TP) reduction. TSS and volume reductions are also shown. For more information on each project refer to the Summary of preferred stormwater retrofit opportunities ranked by cost-effectiveness with respect to total catchment profile pages in this report.

For a full report please contact the Anoka Conservation District

Carp Barriers Installation

Description:

This project will improve water quality in Martin and Typo Lakes by controlling carp with strategically placed barriers and increased commercial harvests. Both lakes fail to meet state water quality standards due to excessive phosphorus which fuels algae blooms. As a result, the lakes are often strongly green or brown and the game fishery is depressed. Carp are a major cause of poor water quality in these lakes, diminishing their value for swimming, boating, and fishing.

Barriers are an effective strategy for carp control because Typo and Martin Lake each provide something important for carp, and moving between the lakes is important to their success. Martin Lake is deeper, and good for overwintering. Typo Lake and Typo Creek are shallow and good for spawning. Stopping migrations between the lakes with barriers will reduce overwintering survival and spawning success. Even more, barriers will allow successful commercial carp harvests.

Purpose: To improve water quality.

Results: In 2014 the SRWMO installed one carp barrier in the Martin and Typo Lake system with the

approved financing and planning for three additional barriers to be installed in 2015.

During and completed installation of first barrier.

Lakeshore Landscaping Education

Description: One goal of the Sunrise River WMO is to encourage and facilitate lakeshore restorations with

native plants. These projects, usually accomplished by homeowners with assistance from agencies like the SRWMO, are beneficial to overall lake health. By planting native plants at the shoreline runoff into the lake is filtered, and fish and wildlife habitat is substantially improved. To move toward its goal, the SRWMO does regular education and marketing of lakeshore

restorations to homeowners.

Purpose: To improve lake water quality and lake health.

Results:

SRWMO 2014 press release, which was published in member city newsletters: Lessons in Landscaping: The Water's Edge

When Jean and Mike Bury purchased a home on Coon Lake in 1975, their 105 feet of shoreline had a few trees. The rest was turf grass. "We spent a multitude of hours mowing to the water's edge, removing the weeds and raking the sand," explained Jean. In the years since, they've turned that blank canvas into art that seems to be equally appreciated by fellow lakeshore owners, Coon Lake visitors, and local wildlife like frogs, ducks and fish.

"In the 90's we read an article in the Star Tribune about the City of Minneapolis park system implementing several projects around the lakes and creeks, restoring them with natural vegetation and the environmental benefits in doing so," recalls Jean. "We set a goal to naturalize 80 feet of our shoreline and leave 25 feet sandy for our dock and recreation space."

The Bury's created outdoor rooms of landscaping, carpeted with turf grass but framed by warm natural areas. Their gardens have clear limits and are tidy around the edges. Farther from the edges, the gardens have a more natural appearance with tall, fountain-like grasses and colorful wildflowers. Particularly at the lakeshore, there are an abundance of native plants. Planting in groupings and curving borders ensure it is much more attractive than a simple strip along the lakeshore.

Also on Coon Lake, fellow gardener Michelle Rogers has been meeting the challenges of lakeshore landscaping with her own creative flair. In 2006 her lakeshore was turf grass too, with a two foot wide strip left unmowed at the water's edge. It stood in contrast to her flower-lined driveway that burst with color and character.

"We put together a plan to restore our lakeshore," said Rogers. "We picked a palate of mostly native plants that were adapted for either the wetter soils near the water or the drier areas higher in the yard. These are the plants to which wildlife is most adapted. We even added some logs half in the water, half out. We get tons of turtles sunning on them."

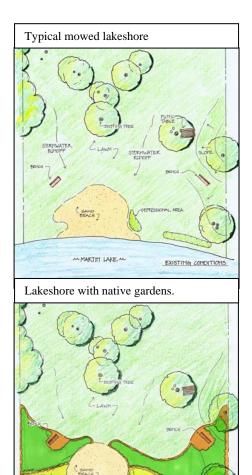

Rogers created a more formal look around the edges using flagstone borders. A path leads to the dock.

Both homeowners say a big part of the plan was to help Coon Lake. The shoreline is important for water quality, wildlife and fish. Native plants, unlike turf, help on all fronts.

Native plants grow densely to create a filter, or buffer, for any runoff before it reaches the lake. They also have deep root systems that hold the soil, protecting it from wave action. Before their shoreline restoration, the Bury's had experienced shoreline erosion.

"One downside of turf grass is that its root system is only about 2 inches deep," says Jamie Schurbon, Water Resource Specialist at the Anoka Conservation District. "If it's all you've got at the water's edge, the bank is susceptible to erosion and undercutting. No one wants to watch their lakeshore wash away. And we don't want that sediment in the lake. Many native plants have root systems that grow more than five feet deep."

Some of the Roger's plantings were actually in the water, with plants like three-stem bulrush that are good fish habitat. "As any fisherman knows, aquatic plants are key fish habitat," notes Schurbon.

MARTIN LAKE M

CONCEPT PLAN

The Bury's took a different approach for plants in the water. "We allowed some cattail in and through the years other native plant species like arrowhead started to grow in the water," adds Jean Bury. They were still able to maintain ample area for the dock and other active use.

Fish aren't the only wildlife. "Many of the plants attract butterflies and dragonflies. We put up bluebird, wood duck and martin houses, which are inhabited most years. We feel we have a science lab on our shoreline for our grandchildren, as we watch tadpoles develop, and explore all the wonders of the ecosystem a natural site offers, said Bury."

"I see lots of butterflies, bees, green herons, hummingbirds and other wildlife," says Rogers. "One typical evening my husband and I were sitting on the dock and watched a muskrat quietly nibble off mountain mint shoots, stack them neatly, and then swim away with them."

This harmonious scene is a far cry from the frustrating, endless battle that many lakeshore homeowners wage against muskrats who dig burrows that damage lawns and create uneven turf for their mower. When you aren't mowing at the water's edge, muskrat activity is no big deal.

Bury also notes another benefit of naturalizing the shoreline: fewer geese. "Geese are uncomfortable in and around taller vegetation because it makes it more difficult for them to see approaching predators, and does not give them a clear line of sight to the water," informs Schurbon.

Perhaps the most important selling point for native gardens that these homeowners can tout is that it looks great. "The textures of the naturalization project and other plantings reward us with year round visual interest," says Bury. "We frequently have neighbors, garden clubs and boats pulling up to our dock in the summer to view the gardens. We always inform people that it does not have to be as grand of scale as we designed ours; a smaller buffer zone on their shoreline still benefits the lake and wildlife greatly." Rogers agrees, "It's spreading."

Locally, the Sunrise River Watershed Management Organization offers grants to partially pay for these projects that benefit the lake. Applications are accepted through the Anoka Conservation District, which also provides free on-site consultations and can guide homeowners through the design and budgeting process.

For more information, the "Blue Thumb – Planting for Clean Water" program is a good resource. Their website includes an interactive native plant selector tool. Input your sunlight conditions, moisture, color and even level of care to produce a custom list.

Landowners should note that permits are required from the DNR for any project below the ordinary high water mark, which is the highest level the water has been for a sufficient period of time to leave evidence on the landscape. It is often higher than most homeowners expect.

The Anoka Conservation District can be reached at 763-434-2030.

Evening view over Coon Lake at the Bury residence.

Lakeshore restoration at the Rogers Residence. Coon Lake.

Blue Thumb membership – Blue Thumb is a consortium of Minnesota agencies, plant nurseries, landscapers, and others who share resources in their efforts to promote the use of native plants to improve water quality through shoreline stabilizations, rain gardens, and native plant gardens. Resources that are shared amongst Blue Thumb members include pre-fab marketing materials, displays, how-to manuals, and others. The ACD enrolled the SRWMO in Blue Thumb and performed all necessary administration to maintain the membership and renew it in 2014.

The ACD manages the SRWMO's Blue Thumb membership by submitting annual membership applications and tracking SRWMO contributions. Maintaining a Blue Thumb membership requires an annual contribution of either \$1,500 cash or 30 hours of efforts. The SRWMO chooses to meet this requirement by incorporating Blue Thumb into a variety of tasks that are already planned and benefit from Blue Thumb (including those listed above). In 2014 the SRWMO exceeded the 30 hour commitment with the following work:

- Postcard with information on grant availability
- Presentations at Linwood Family Fun Day, East Bethel Booster Days, and Columbus Arbor Day
- Grant applications for potential projects.
- Martin Lake rain garden maintenance.

Annual Education Publication

Description: An annual newsletter article about the SRWMO is required by MN Rules 8410.010 subpart 4, and

planned in the SRWMO Watershed Management Plan.

To improve citizen awareness of the SRWMO, its programs, and accomplishments. **Purpose:**

Results: In 2014 the SRWMO contracted with the ACD to write the annual newsletter and provide it to

member communities for distribution in their newsletters. Topics for annual newsletter were

discussed by the SRWMO Board, wetland Protection was chosen.

Limited space in city newsletters was recognized as an issue. A poem was written and submitted to catch the reader's attention and best utilize the limited space available. It was provided to member cities for their city newsletters in June.

Mosquito Retaliation

I hate mosquitoes

With all of my heart

Buzzing and biting

Living, sucking darts

Squished ones are left on me As bloody body art

An omen to others

To quickly depart

But yet they persist

I must give them credit

We've drained half their wetlands

If that's a hint, they don't get it

They mount up on wings

With sick humor and wit

And bite me in places

I hate to admit

They're settling the score

Retaliation - here's why

For the wetlands we've mowed, filled

Or drained completely dry

They're enlisting their friends Like the loathsome black fly

And signing up birds

To drop bombs from the sky

Surrender - I'll never!

Mosquitoes deserve no respect

But wetlands are worthy

And useful to protect

They clean the water for free

That often we've wrecked Are home to more good critters

Than you'd ever suspect

So please don't dig, drain or fill them

As the law does expect

This is a message from the Sunrise River

Watershed Management Organization.

www.SRWMO.org

Wetlands are critical habitat for desirable wildlife, filter water before it gets to our lakes and rivers,

and help prevent flooding.

Please respect the laws that prohibit filling,

draining, or excavating in them. Unmowed

buffers at the edge of wetlands are especially

valuable

SRWMO Website

Description: The Sunrise River Watershed Management Organization (SRWMO) contracted the Anoka

Conservation District (ACD) to design and maintain a website about the SRWMO and the

Sunrise River watershed.

Purpose: To increase awareness of the SRWMO and its programs. The website also provides tools and

information that helps users better understand water resources issues in the area. The website

serves as the SRWMO's alternative to a state-mandated newsletter.

Location: www.SRWMO.org

Results: In 2013 the upgraded, redesigned, and re-launched the SRWMO website. These updates were

necessary because the old website platform was incompatible with certain tablet computers and smartphones. Additionally, the old website was hosted with in the ACD website, while the new

website is completely independent, offering the WMO future management choices.

Regular website updates also occurred throughout the year. The SRWMO website contains information about both the SRWMO and about natural resources in the area.

Information about the SRWMO includes:

• a directory of board members,

meeting minutes and agendas,

• the watershed management plan and information about- plan updates,

descriptions of work that the organization is directing,

• highlighted projects.

New 2013 SRMWO Website Homepage

Grant Searches and Applications

Description: The Anoka Conservation District (ACD) assisted the SRWMO with the preparation of grant

applications. Several projects in the SRWMO Watershed Management Plan need outside funding

in order to be accomplished.

Purpose: To provide funding for high priority local projects that benefit water resources.

RESULTS:

BWSR Clean Water Fund Grant Application

\$73,824 grant request \$18,456 match Outcome of application will be known January 30, 2015.

Title: Ditch 20 Wetland Restoration Feasibility Study to Benefit Downstream Water Quality

Abstract

This feasibility study will produce strategies for wetland restoration and ditch hydrology changes that improve water quality in Typo and Martin Lakes, the Sunrise River and St. Croix River. Our focus is County Ditch 20 (aka Data Cr), which drains >500 acres of wetland. 1849 land surveys show the area as "tamarack swamp." But by 1938 there were no trees, active haying and a network of ditches. Downstream waterbodies were declining. Recently, TMDL studies have found that these ditched wetlands export large amounts of phosphorus and solids.

This project is unique because it targets a pollutant source that is often overlooked but common – ditched wetlands. The Ditch 20 subwatershed has seemingly benign land uses. Yet during storms its phosphorus concentrations were 70% higher than that of neighboring Ditch 13 which is mostly agricultural. As a result, the local watershed plan and TMDLs noted this as a key area for pollutant reduction.

Mechanisms of phosphorus export from ditch 20 were studied over 6 years. Multiple mechanisms are at work, including aerobic decomposition of peat soils, periodic re-wetting, effective drainage of soil water and bank sloughing. These mechanisms can be managed through lateral ditch blocks, water level manipulation, settling basins or other measures.

A feasibility study is needed before construction. We'll use surveying, terrain analysis and hydrologic/hydraulic modeling to evaluate the scope and effects of potential projects. We'll involve landowners early. We'll evaluate the cost/benefit ratio of each project by consolidating primary literature knowledge and applying it, because pollutant models or calculators are not available for this type of project. Finally, we'll prepare designs.

We anticipate designed projects can be installed within 1-3 years after study completion. The watershed management organization plans to budget sufficient funds to match installation grants.

SRWMO 2013 Annual Report to BWSR and State Auditor

Description:

The Sunrise River Watershed Management Organization (SRWMO) is required by law to submit an annual report to the Minnesota Board of Water and Soil Resources (BWSR), the state agency with oversight authorities. This report consists of an up-to-date listing of SRWMO Board members, activities related to implementing the SRWMO Watershed Management Plan, the status of municipal water plans, financial summaries, and other work results. The SRWMO bolsters the content of this report beyond the statutory requirements so that it also serves as a comprehensive annual report to SRWMO member communities. The report is due annually 120 days after the end of the SRWMO's fiscal year (April 30th).

The SRWMO must also submit an annual financial report to the State Auditor. They accept unaudited financial reports for financial districts with annual revenues less than \$185,000.

Purpose: To document progress toward implementing the SRWMO Watershed Management Plan and to

provide transparency of government operations.

Locations: Watershed-wide

Results: Anoka Conservation District (ACD) assisted the SRWMO with preparation of a 2013 Sunrise

River WMO Annual Report. ACD drafted the report and a cover letter. After SRWMO Board review the final draft was forwarded to BWSR in spring of 2014. A sufficient number of copies of the report were sent to each member community to ensure that each city council person and town board member would receive a copy. The report is available to the public on the SRWMO

website.

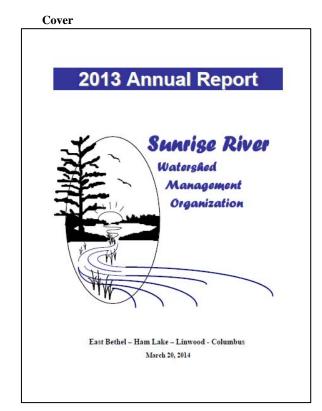

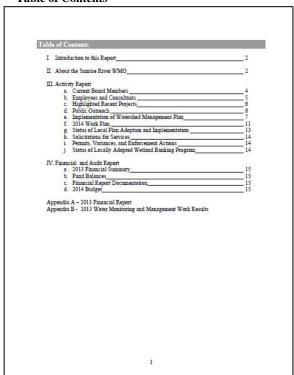

Table of Contents

On-call Administrative Services

Description: The Anoka Conservation District Water Resource Specialist provides limited, on-call

administrative assistance to the SRWMO. Tasks are limited to those defined in a contractual

agreement.

Purpose: To ensure day-to-day operations of the SRWMO are attended to between regular meetings.

Results: In 2014 a total of 24.0 hours of administrative assistance have occurred as of December 31.

The following tasks were accomplished:

• 2015 budget preparation and related questions from cities.

• 2016 draft budget preparation.

 Occasional inquiries from contractors and developers about any SRWMO permitting requirements.

SRWMO Blue Thumb annual reporting.

 Advise the board regarding proposed revisions to MN Rules 8410 and assist in preparing an official WMO comment.

 Provide Linwood Twp with content for their website about the SRWMO, per their request.

Notices to reschedule August mtg.

• Prepare agenda, packet, minutes for Sept meeting in the recording secretary's absence.

Financial Summary

ACD accounting is organized by program and not by customer. This allows us to track all of the labor, materials and overhead expenses for a program. We do not, however, know specifically which expenses are attributed to monitoring which sites. To enable **Sunrise River Watershed Financial Summary**

reporting of expenses for monitoring conducted in a specific watershed, we divide the total program cost by the number of sites monitored to determine an annual cost per site. We then multiply the cost per site by the number of sites monitored for a customer.

Recommendations

- ➤ Install stormwater retrofits around Coon Lake. A stormwater assessment is being completed. It identifies and ranks stormwater retrofit projects that will benefit lake water quality. A state grant has been secured.
- ➤ Continue efforts to secure grants. A number of water quality improvement projects are being identified. Outside funding will be necessary for installation of most of these. These projects should be highly competitive for those grants.
- ➤ Bolster lakeshore landscaping education efforts. The SRWMO Watershed Management Plan sets a goal of 3 lakeshore restorations per year. Few are occurring. Fresh approaches should be welcomed.
- ➤ Continue the SRWMO cost share grant program to encourage water quality projects.
- ➤ Encourage communities to report water quality projects to the SRWMO. An overarching goal in the SRWMO Plan is to reduce phosphorus by 20% (986 lbs). State oversight agencies will evaluate efforts toward this goal. Both WMO and municipal project benefits should be counted.
